EXPLORING BRAIN STRUCTURE AND FUNCTION OF YOUNG CHILDREN AT RISK FOR STUTTERING

Do you have a baby aged between 6 and 18 weeks of age? Would you like to help us understand the nature and cause of stuttering?

The Australian Stuttering Research Centre is conducting a study to explore the brain structure and function of young children at risk for stuttering.

Babies will be scanned using magnetic resonance imaging (MRI). This will cause no harm to your child. Scanning will take place at the Brain and Mind Research Institute, Camperdown.

We are seeking babies aged between 6 and 18 weeks of age, with and without a family of history of stuttering.

A visit will take up to 2 hours and you will be with your child at all times.

You will receive a gift voucher for participating in the study.

If you have a child aged between 6 and 18 weeks of age and would like further information about this study please contact Dr Robyn Lowe at the Australian Stuttering Research Centre, the University of Sydney by email robyn.lowe@sydney.edu.au or call 02 9351 9061.

Participation is entirely voluntary
