Q: What do these three things have in common?

Our laboratory is interested in how the balance (vestibular) system develops, detects changes in position, and ultimately combines this information with other senses such as vision and proprioception to allow us to navigate through our complex world. We use a variety of anatomical and physiological techniques including immunohistochemistry and patch-clamp electrophysiology.

For more information about current projects and honours opportunities please contact Dr. Aaron Camp: Rm E501 Anderson Stuart Bldg aaron.camp@sydney.edu.au; Ph 02 9351 9140
