

Funding

The survey was funded primarily by NSW Health. In addition, the NSW Department of Education and Training funded several members of the field team.

Dr Karen Webb

Dr Li-Ming Weng

Dr Jo Williams

Thank you

Many individuals were involved in this study and their valuable contributions were greatly appreciated. Some, however, deserve special acknowledgment.

Louise Hardy, Sandie Hodgson, and Rachel Wilkenfeld were outstanding in their roles as Project Officers. They were responsible for many tasks, including: liaising with schools and field staff; preparing instruments for data collection; collecting, cleaning, and entering data; and the overall day-to-day running of the study. They completed these tasks with the highest level of professionalism and competency, putting in many unpaid hours to complete tasks on time and to the standard required. Nothing was too difficult for them to handle and their optimistic and cheerful characters made working with them an absolute pleasure.

Baohui Yang was an excellent statistician. She frequently had to cope with requests to re-analyse data and to do this in a short time period. The fact that she could accomplish such tasks speaks most highly of her professionalism and statistical ability. Tim Dobbins and Kate Williams performed statistical analyses during the latter part of the study. Their tasks were completed quickly and proficiently and this saved much time during these stages. Adrian Bauman generously provided a full-time statistician to work on SPANS and also advised on research design and statistical analyses. Louise Erickson spent many hours assisting with the editing and formatting of the final report; Lesley King provided insightful and helpful editorial comments and advice.

The field teams were an extremely dedicated group of teachers and research students. They collected the data with the utmost attention to detail, often under very trying conditions and seldom resting during the day. Their rapport with schools and teachers was most professional and caring. They often had to travel long distances and worked many hours above and beyond a normal school day.

The schools and their staff were most supportive of the study. They were extremely accommodating in our requests and the disruptions we made to their timetables. We appreciated the way they made the field teams and researchers welcome and a part of each school.

We thank the parents for their valuable contribution and support for the study. Finally, we thank the students involved. They had to concentrate for sustained periods, often in hot conditions, and wait patiently to perform their physical assessments. They did this maturely and were a credit to their schools and their education sector.

Anthony Okely
Elizabeth Denney-Wilson
Michael Booth
