

INSTRUCTIONS / INFORMATION FOR AUTHORS

Invited Speaker:

8 Page Invited Speaker paper - 45 Minute presentation which will include both the introduction and discussion time. With the exception of our special Presidents Address Session for 2012 which will be a 20 minute presentation by each Australian President, WPSA and WVPA, concluding with a question and answer forum.

Submitted Paper:

1-4 Page paper - 15 Min Presentation - 12 minute presentation with 3 minutes for introduction and discussion.

Short Communication:

1-4 Page paper – 5 Min Presentation – (as requested or advised by the editorial committee). This session includes a maximum of 5 Slides with no question time.

- Slide One: Title, Authors and Affiliations,
- Slide Two: Aims and Objectives
- Slide Three: Methods
- Slide Four: Key Results
- Slide Five: Implications etc.

Any papers received not conforming to the following format will not be accepted or reviewed, they will be returned.

Page Setup:

1. Please select **A4 paper size** (21.0 x 29.7 cm).
2. Type within the dimensions of 2.54 cm (1") margins top/bottom and left/right.
3. Typescript is Times New Roman, 12 point. The published papers will be printed in a standard 12 point font.
4. Line spacing of 1.0.
5. Full justification.
6. Pages are **not** to be numbered.

Layout:

7. Title of paper should be in capitals and centered
8. Leave one blank line and type authors' names in capitals except for "and" **also please use "footnotes" to put in institution and email address for each of the authors.**
9. Leave one blank line and type **Summary** centered and underlined with only the first letter capital.
10. Leave one blank line before the text and before subsequent headings.
11. No need for indentations in the **first** paragraph of each section but subsequent paragraphs need to be indented 1.27cm (0.5")
12. No space to be left between paragraphs.
13. Leave one blank line and type INTRODUCTION in capitals, centered and numbered in roman numerals e.g. I. INTRODUCTION. Each main heading is to be numbered, centered and in capitals.
14. Sub-headings are to be centered, underlined and numbered alphabetically with only the first letter of the first word in capitals with one blank line above and below the heading.
15. One Page papers do not contain summaries or introductions etc. First paragraph fully justified, subsequent paragraphs are indented as above.

Technical Data:

16. All data must be in metric units. The SI system should be followed except that time may be measured in hours (h), minutes (min) and seconds (s), angles in degrees and temperature in °C. Use the 24 h clock, e.g. 1500 h, 0930 h.
17. Do not use a comma in numbers with more than 3 digits. Use the full stop, not raised, to represent the decimal point e.g. 2.345 All numbers less than unity should have a zero before the decimal point e.g. 0.35 not .35.
18. Use "P < 0.01" not "P<0.01".
19. Spell "**and**" in full and use numbers for all units and quantities (e.g. 8.0 mm, 6.0 kg). In descriptive text, numbers from one to nine are spelled out and numbers are used for 10 and over.
20. Tables should be typed in single spacing and placed in a logical position in the text. Tables are to be centered with respect to the side margins of the page and no text is to be wrapped alongside the table.

21. All tables should be numbered above, and all figures numbered below, with an Arabic numeral in the form... Table 1 or Figure 1.... and this should be followed on the same line by an indent (1.27 cm/0.5") and then the title, which should **not** be underlined. All lines in the title should be similarly indented. Capitals should only be used for the first letter of the first word and for other words which normally require capitals. In tables, each column or row heading should have only the first letter of the first word in capitals.
22. In tables, headings should be separated from the title and data by horizontal lines and the data should be separated from the footnotes or the following text by a horizontal line. Leave one blank line between the table and the following text. Do **not** use vertical lines, shadings or colours in tables.
22. SI units are required. Tables of diets for example are therefore in g/kg and not in %. Chemical composition of feedstuffs are also in g/kg and not in %. A reminder to also express ME values as MJ rather than kcal.

Data needs to be compiled in clearly constructed tables and or figures to support observations made in the results and discussion section.

References:

24. All references in the text should be listed alphabetically at the end of the paper.
25. References in the text should be given as Smith and Jones (1967) or (Smith and Jones, 1967), and where the paper to be cited contains more than two authors as Cowan et al. (1980) or (Cowan et al., 1980). Square brackets should not be used.
26. The section heading REFERENCES should be centered, in capitals but not numbered.
27. In the REFERENCE list, the authors' surnames should be in mixed case with the first letter capitalised and the initials capitalised and following the surname. The authors' name(s) should be followed by the year of publication in brackets. The source should be in italics, volume in bold, followed by the first and final page numbers. (Title of paper is **not** required but title of book should be given where relevant.) If following on a second line, the reference should be indented along with the rest of the text. Editors of books and conference proceedings should be given.

TWO-DAY-OLD DUCKLINGS INTERACT MORE WITH A BELL DRINKER THAN A NIPPLE DRINKER SUSPENDED ABOVE A TROUGH

G.M. CRONIN¹, K.J. WILLIAMS¹ and J.A. DOWNING¹

Farming ducks for meat production is increasing in Australia. In Europe, the welfare issues associated with intensification of meat duck production were reviewed by Rodenburg et al. (2005), who identified the manner in which water was provided was a potential welfare issue. Specifically, concerns were raised whether ducks require access to 'open water' for their welfare, since open water stimulated the performance of preening, dabbling, head-dipping, bathing and swimming (Rodenburg et al., 2005). However, a consequence of water-related behaviours was that more water may be used, resulting in increased spillage and reduced litter quality. Cooper et al. (2002) investigated the behaviour of young ducks provided open water via bell drinkers compared to nipple drinkers. Young ducks had a clear preference for bell drinkers and placed a higher value on wider, deeper drinkers that allowed a greater range of drinker-related activities than nipple drinkers alone. The objective of the present experiment was to investigate the preference of 2-day-old ducks for two water presentation systems, which provided different levels of open water but which, in principle, were constructed using similar water-holding structures that permitted the ducks to sit in a trough.

Six pens of 36 ducklings (Cherry Valley and Grimaud Freres) were continuously video recorded from the time of placement in pens at day-old. The ducklings were restricted to an area of ~3.1 m² within pens measuring 3.0 m x 1.5 m in an environment controlled shed. Lighting was continuous and heating was provided in each pen by an infra-red globe heater suspended 0.6 m above the floor, which was 50 mm deep wood shavings. Feed was available *ad libitum* from a 40 cm diameter tray and a circular feeder. Water was provided by a bell drinker positioned in the middle of the pen (Multiquip Pty Ltd, Austral, NSW, 13 l water capacity, 35 cm diam) and three nipple drinkers with water catching 'cups' about 0.5 m apart, suspended above a trough on one side of the pen. The number of ducklings interacting with the bell drinker and the trough was collated from the digital video record at 5-min intervals for 24 h commencing at 1200 h on the second day of life. Interaction with the water facility was defined as ducklings having their head adjacent to (within 2 cm) or over the bell drinker or trough. The number of ducklings sitting in the bell drinker or trough was also recorded. The data were analysed using a two-sample T-test (paired) in Genstat (Release 11.1 (2008) VSN International Ltd., UK) and the experimental unit was the pen of ducklings.

The likelihood that ducklings were observed at the bell drinker was twice that for the nipple drinker/trough system

Example 2-8 pages:

**THE EFFECTS OF STRAIN AND SEASON ON THE PERFORMANCE OF COMMERCIAL
DUCKS UNDER AUSTRALIAN CONDITIONS**

J.A. DOWNING¹ and W. TAYLOR²

Summary

The Australian duck industry has a very specific market requirement, this being for a 2.85 kg bird at 6 weeks of age. The strains of Pekin duck presently used in Australia, the Cherry Valley and Grimaud Frères, have different growth characteristics but both have difficulty meeting this target weight especially in summer. It was considered that by crossing these two strains, hybrid vigor might allow advantages to be gained in growth performance. The present study investigated the performance of the two main strains of Pekin ducks and their reciprocal crosses grown to 6 weeks of age in summer and winter. Ducks were reared following industry practices. The strains and their crosses were bred by PE'S Ducks Pty Ltd, and reared in single sex groups or as mixed sex groups. In summer only one strain reached market weight by 41 days of age. In winter all strains reached market weight by 41 days but the FCR was higher in winter than summer. Males grew to heavier weights than females in both summer and winter but there was no advantage gained by rearing ducks as single sex groups.

I. INTRODUCTION

Because it is a relatively new industry, the amount of information specific to duck production under Australian conditions is limited. At present, two different strains of Pekin duck are used by the Australian industry, the Grimaud Frères (GF) and the Cherry Valley (CV). Both have distinct growth
